Abstract

Interworking of equipment units by means of hypertext home pages

5   Plural primary equipment units and a manager equipment unit are linked in order to constitute an evolutionary virtual terminal combining functions available in the equipment units. First, presentations are stored in the equipment units. The presentation of

10   each equipment unit contains at least one link to a function of the equipment unit. Then the manager equipment unit recovers the presentations and composes a home page with the presentation of the manager equipment unit and the recovered presentations of the primary

15   equipment units. The home page as a home page for all the equipment units is downloaded from the manager equipment unit into all the equipment units. The functions of the equipment units of the group can be accessed from any equipment unit of the group.
